

SrTiO₃

$Pm\bar{3}m$ · cubic perovskite

Goldschmidt $t = 0.95$

Structure

schematic projection

- A-site cation
- B-site cation
- X-site anion

GdFeO₃

$Pnma$ · distorted perovskite

Goldschmidt $t = 0.80$

FeTiO₃

$R\bar{3}$ · ilmenite

Goldschmidt $t = 0.70$

"Bonding" edges

— core edge

- - - extended edge

one node per inequivalent site, one edge per symmetry class
 $\times N$ on an edge = bonds of that class per cation; on a node = sites per formula unit

Polyhedral edges

— corner sharing

— edge sharing

— face sharing

— 4+ sharing

loops = sharing between symmetry-equivalent sites
